

Explanation of the Business Model Canvas:

Key Partnerships:

Travi wants to build a large network of partners. These include major travel platforms such as Booking.com, Check24 and Skyscanner. Offers and commissions can be integrated via these platforms. Payment service providers such as Stripe will ensure secure and convenient payments. Universities will be used as a test environment to try out new features. Tourism associations will act as strategic partners, supporting the integration of local content and increasing reach.

Key Activities:

Travi's core activities include developing and continuously maintaining the app, as well as further developing the algorithm for destination suggestions. Establishing and maintaining partnerships with travel providers is also essential. In addition, great importance is attached to marketing and community engagement in order to retain users in the long term and reach new target groups. All these activities are necessary to ensure the quality of the app and enable sustainable growth.

Key Ressources:

Travi's most important resources are its technology and its team. Developers and UX designers are essential for the continuous development of the app. A powerful recommendation algorithm that recognises user preferences and generates suitable travel suggestions forms the technical core. External offers from travel providers can be used via interfaces (APIs). Compliant and scalable server solutions are required to ensure data protection and availability. In addition, financial resources such as start-up capital and investors are crucial for the growth of the company.

Value Propositions:

Travi offers users a stress-free and time-saving way to organise group trips. A playful swipe system makes selecting destinations or activities a fun experience. The entire planning process is handled via a central platform, which can also be used to make bookings and payments. The focus is on democratic decision-making in order to avoid conflicts and actively involve all group members. Intelligent functions simplify planning for everyone involved and make it more accessible.

Customer Relationships:

The customer relationship is based on active participation and self-determination. Travi promotes community through features such as feature voting and feedback forums. This allows users to actively contribute to the further development of the app. User opinions are directly

integrated through co-creation in the form of beta tests and surveys. At the same time, the intuitive user interface enables easy self-service. For further support, a chatbot and email support are available, creating a good balance between automation and personal assistance.

Channels:

Travi uses various distribution channels to reach its target groups and make the app available. The most important access point is via app stores such as iOS and Android. In addition, social media, especially platforms such as Instagram and TikTok, play a central role in appealing to younger users. Recommendations from friends are another effective channel. To present the app in a targeted manner, Travi also uses travel fairs and university events, where potential users can be directly addressed and engaged.

Customer Segments:

Travi is aimed at group travellers who want to plan their trips together. This includes groups of friends, families, clubs and other social groups. A key characteristic of this target group is the desire for fair, inclusive and democratic decision-making processes. Particular consideration is also given to people with little digital experience, for whom simple and intuitive usability is important. Travi aims to solve the typical challenges of group decision-making and enable all participants to participate equally in the planning process.

Cost Structure:

The cost structure primarily comprises technological and personnel expenses. Key cost factors include app development and maintenance, as well as the use of external APIs and licences. A stable server infrastructure is also required to operate the platform. Additional costs arise from marketing measures and community maintenance. Finally, salaries for technical, creative and support staff also account for a significant portion of running costs.

Revenue Streams:

Travi generates revenue from several sources. Firstly, it earns commissions on bookings made through partners such as Booking or Skyscanner. In addition, the app follows a freemium model: basic functions are free, while premium functions such as advanced travel analyses are subject to a fee. Travi also offers targeted advertising space for selected providers. Another source of income is the provision of API access for external platforms, which can then access Travi data and functions.
